

# Albatros Real Estate Website

## Graduation Project Documentation

# 1. Project Planning & Management

## Project Proposal

**Project Name:** Albatros Real Estate Website

Albatros is a full-stack web-based real estate platform built using ASP.NET Core. The system allows users to browse, search, and manage property listings efficiently. It connects property owners, customers, and administrators in a unified platform that simplifies real estate transactions and property discovery.

## Project Objectives

- Develop a responsive real estate website.
- Enable users to search and filter properties based on different criteria.
- Allow property owners to add, edit, and manage their listings.
- Implement a visit request system for customers.
- Provide authentication and authorization for different user roles.
- Ensure a smooth and user-friendly experience.

## Project Plan

The project is developed through the following phases:

- Requirements Gathering

- System Analysis & Design
- Database Design (ERD)
- Implementation (Frontend & Backend)
- Testing & Debugging
- Deployment

## Roles & Responsibilities

- **Project Manager:** Oversees planning, execution, and delivery.
- **Backend Developer:** Implements business logic, APIs, and database operations.
- **Frontend Developer:** Develops user interface and user experience.
- **Database Designer:** Designs ERD and database schema.
- **QA Tester:** Ensures system quality and detects bugs.

## Risk Assessment & Mitigation

- **Security Risks:** Handled using JWT authentication and secure coding practices.
- **Performance Issues:** Optimized queries and efficient data handling.
- **Data Consistency:** Proper database design and relationships.
- **System Bugs:** Testing phase to identify and fix issues.

## KPIs (Key Performance Indicators)

- System response time
- Successful authentication rate
- Property search efficiency
- System availability (uptime)
- User engagement rate
